

## Swing Carriages

Swing Carriage - The load capacity of a lift truck jib has a most of about 1935 lbs up to 6000 pounds on either the retracted or extended positions range. You may want to check with a material handling specialist regarding the specific limits of your lift truck application. The load capacity ratings are intended for the jib itself and not the lift truck or the maximum load which could be handled safely making use of a certain forklift. It is very important bear in mind that each time whatever accessories like for example a forklift jib are connected to the forklift, the new center of gravity created by the attachment would lessen the overall lift capacity of the forklift. There are directions accessible which offer details on how to properly determine these load limits.

Before using any forklift jib, be sure that the hooks and shackles are correctly secured to the forklift. Be sure and also double check that the pins are tight. It is necessary that the weight calculations have been properly made and double checked. Bear in mind to take into account the fact that rated capacities at times lessen each time the boom is in a raised position, when the boom is fully extended with telehandlers or whenever the mast is tilted forward.

A few significant tips regarding the modifiable jib are: do not ever pull a load with a forklift jib attachment, for the reason that these accessories are really designed for vertical lift only. At all times pick up the load without letting it sway. Use extreme caution every time a load is lifted to be able to avoid tipping over the truck.
